# What is a winning number display?

**A winning number display is a visual tool used to announce the winning numbers in games like roulette or lottery. It's typically placed in a prominent location, ensuring visibility for all players.**

**After market research, CDS listened and produced a digital WND range which met all the key requirements**

- **High Quality and Competitive**

- *The CDS DELTA strategy is used; A balance of QUALITY | PRICE | SERVICE. Industrial components are used to ensure high performance, quality and longevity of supply. As CDS manufacture the solutions, the tier supply chain is reduced as is the margin stack / price. The CDS service is a given, we don't sell part numbers, we sell solutions and every solution is important to our reputation..*

- **Mechanically practical and aesthetic**

- *Although biased, CDS believe their solution looks good and is solid once mounted to the table. We hope two ticks for the design*

- **Dynamic presentation: High impact, flashing lights, to draw attention!**

- *The CDS solution use premium components ensuring maximum impact. The LED 'HALO' can be pre-set to a colour / sequence or triggered to give an dynamic visual effect on an event*

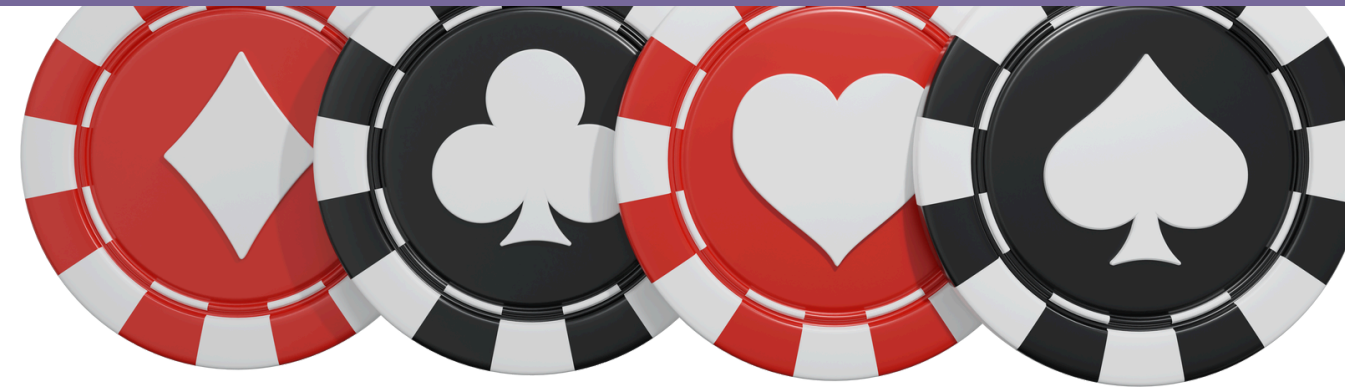

- **Variety of sizes to accommodate the different size table and environment!**

- *CDS have addressed this by starting the range with three popular sizes; 23.8", 27" and 32". As this is a CDS designed solution, subject to brief, customisation and branding is an option*

# What is a winning number display?

This sleek, modern, edge-to-edge HALO LED frame offers a professional and visually striking solution that significantly elevates the aesthetics of any space. Its minimalist design seamlessly blends with contemporary interiors, while the advanced LED technology delivers exceptional image quality and vibrant colours. The frame's slim profile and expansive viewing area create an immersive viewing experience, making it ideal for the casino environment

The display head's minimal design is achieved by separating the electronics, connected via an umbilical cord. This allows the control electronics to be placed in a convenient, serviceable location, typically beneath the table. The electronics accept single or dual HDMI inputs, enabling either mirrored content or independent visuals on each side of the display.
